1.0 INTRODUCTION

H&S Environmental, Inc. (H&S) has prepared this Quarterly Operations Report for the First Quarter 2013 for the Soil Vapor Extraction Containment System (SVECS) at Site 1, Former Drum Marshalling Area, at the Naval Weapons Industrial Reserve Plant (NWIRP) in Bethpage, New York. This report has been prepared for the U.S. Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC), Mid-Atlantic, under Contract No. N40085-10-D-9409, Contract Task Order (CTO) No. 0005. This First Quarter 2013 Operations Report details activities that occurred from January 2013 to March 2013. Data was collected and operational activities were performed by H&S in accordance with the following documents:

- *Final Operation & Maintenance Plan for Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant Bethpage, New York* prepared by Tetra Tech EC, Inc. (TtEC) in 2010, hereafter referred to as the “O&M Manual.”
- *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan for the Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by Tetra Tech NUS, Inc. (TtNUS) in 2012.

1.1 Site Location

NWIRP Bethpage is located in east central Nassau County, Long Island, New York, approximately 30 miles east of New York City. The Navy's property totaled approximately 109.5 acres and was formerly a Government Owned Contractor-Operated (GOCO) facility that was operated by Northrop Grumman (NG) until September 1998. NWIRP Bethpage is bordered on the north, west, and south by property owned, or formerly owned, by NG that covered approximately 520 acres, and on the east by a residential neighborhood. Site 1 lies within the fenced area of NWIRP Bethpage and is located east of Plant No. 3, west of 11th Street, and north of Plant 17 South (**Figures 1 and 2**).

1.2 Background

NWIRP Bethpage was established in 1943. Since inception, the primary mission of the facility has been the research, prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft. Historical operations that resulted in hazardous material generation at the facility included metal finishing processes, maintenance operations, painting of aircraft and components, and other activities that involve aircraft manufacturing. Wastes generated by plant operations were disposed of directly into drainage sumps, dry wells, and/or on the ground surface, resulting in the disposal of a number of hazardous wastes, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and inorganic analytes (chromium and cadmium) at the site. Some of these contaminants have migrated from the source area to surrounding areas, including the soils at these sites and the groundwater beneath and downgradient of the NWIRP Bethpage property. NWIRP Bethpage is currently listed by the New York State Department of Environmental Conservation (NYSDEC) as an “inactive hazardous waste site” (#1-30-003B).

Soils at Site 1 consist mainly of unconsolidated sediments that overlie crystalline bedrock. A clay unit is present near the groundwater table (50 feet below ground surface [bgs]) at the southeast corner of the site. This clay unit is suspected to be a source of chlorinated solvents that are migrating into the overlying soil gas and the source of off-site VOCs in soil vapor (TtEC 2010).

Chlorinated solvents including trichloroethene (TCE), tetrachloroethene (PCE), and 1,1,1-trichloroethane (TCA) have been identified as the VOCs of interest in soil gas at the site. Concentrations greater than 1,000 µg/m³ (micrograms per cubic meter) of soil vapor have been directly associated with Site 1 activities and historical environmental data, and based on preliminary screening, exceed guidelines established by the New York State Department of Health (NYSDOH) for sub-slab soil vapor concentrations. Of these compounds, TCE is the primary VOC of concern. Mitigation of TCE contamination in accordance with NYSDOH guidance is expected to remediate other VOCs associated with the site. PCBs, cadmium, and chromium have also been identified in site soils at concentrations requiring remediation. The majority of these chemicals has been detected in the central portion of Site 1 and will be addressed via a separate remediation (TtEC 2010).

Prior to implementation of the SVECS, the mean concentrations of VOCs in soil gas samples collected along the eastern fence-line were 41,128 µg/m³ of TCE, 381 µg/m³ of PCE, and 20,634 µg/m³ of 1,1,1-TCA. The maximum concentrations of VOCs in the soil gas samples were 180,000 µg/m³ of TCE, 1,200 µg/m³ of PCE, and 90,000 µg/m³ of 1,1,1-TCA (TtEC 2010).

1.3 Project Overview and Objective

The remedial objective for this project is to use an on-site soil vapor extraction system to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture contaminated soil vapor with a TCE concentration greater than 250 µg/m³. A secondary objective of this project is to address soil vapor with a TCE concentration greater than 5 µg/m³. The SVECS is an interim action intended to address migration of VOCs in contaminated soil vapors and has been designed for a four-year operational life; it is expected to operate continuously 24 hours/day, seven days/week, with the exception of maintenance and adjustment periods (TtEC 2010).

1.4 SVECS Overview

The SVECS consists of soil vapor extraction, soil vapor monitoring, and soil vapor treatment. Twelve SVE wells (SVEWs) are located along the eastern boundary of Site 1 in six clusters, each consisting of one intermediate well and one deep well. Intermediate wells SVE-101I, SVE-102I, SVE-103I, SVE-104I, SVE-105I, and SVE-106I have a screened interval between 25 and 35 ft bgs. Deep wells SVE-101D, SVE-102D, SVE-103D, SVE-104D, SVE-105D, and SVE-106D have a screened interval between 40 and 60 ft bgs. The groundwater table fluctuates between approximately 50 and 55 feet bgs. Each SVEW is operated at a flow rate such that the combined total flow rate is approximately 400 standard cubic feet per minute (scfm) of soil vapor. Each intermediate depth SVEW requires an approximate vacuum of 4 inches of water column (i.w.) and each deep SVEW requires an approximate vacuum of 20 i.w. in order to extract the targeted flow rates. These twelve SVEWs have been piped below the ground to the Flow Monitoring Station (FMS), where flow, vacuum, and vapor quality are monitored. Within the FMS, the

discharges from the individual SVEWs have been equipped with a 2-inch flow control butterfly valve, a vacuum gauge, and a sampling port. The sampling port is utilized to measure the flow rate from an individual well using a portable velocity meter and to collect vapor samples. All the SVE lines collect into a single manifold within the FMS and from this location a single underground pipeline has been routed approximately 1,400 linear feet to the Treatment Building (Building 03-35). Five additional SVEWs (SV-107D, SV-108D, SV-109D, SV-110D, and SV-111D) were installed in October 2011 to address potential VOCs under Plant No. 3 and the South Warehouse. A site plan depicting well locations is included as **Figure 3**.

The SVECS is housed within the Treatment Building, an existing and unoccupied building also known as Building 03-35. The treatment system consists of a moisture separator, two SVE blowers, and a 5,000-lb vapor-phase granular activated carbon (VGAC) unit for removal of chlorinated VOCs from the off-gas. Soil vapor that enters the Treatment Building first passes through the moisture separator tank where any condensate is separated. To date, no condensate has formed in this tank. The vapor is then passed through an air filter and SVE blower and then treated in the VGAC unit. The treated vapor is discharged from the VGAC via an exhaust stack. The SVECS has a control panel comprised of mechanical interlocks and relays for local operation. A System Layout Plan is presented in **Figure 4**, which also illustrates the design flow rates through the soil vapor extraction and treatment process.

The off-gas from the SVECS is monitored for chlorinated VOCs as identified in the NYSDEC Division of Air Resources (DAR) permit equivalent effluent limitations (**Appendix A**) and monitoring requirements (TtEC 2010). Samples are submitted to a National Environmental Laboratory Accreditation Conference (NELAC)-accredited, Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory, Air Toxics, Inc. located in Folsom, CA, for analysis of target compound list (TCL) VOCs, including PCE, 1,1,1-TCA, and TCE , by modified method TO-15.

A total of 18 soil vapor pressure monitor (SVPMP) / soil gas monitoring points have been installed in the neighborhood east of Site 1 at NWIRP Bethpage (**Figure 3**). These off-site monitoring points consist of eight previously existing SVPMPs as well as 10 SVPMPs installed in September 2012. Pressure readings from the SVPMPs are collected quarterly and used to evaluate the SVECS vacuum field. In addition, analytical results of vapor samples collected annually from these locations and the pressure readings are used to further evaluate the SVECS operation and the potential for vapor intrusion.

2.0 SVECS OPERATION AND MAINTENANCE

While designed to run autonomously, the SVECS requires regular visits by an operator to record and adjust operational parameters and to perform scheduled maintenance. The SVECS is equipped with telemetry that will alert an on-call operator in the event of a plant shutdown.

2.1 Routine Maintenance Activities

Routine maintenance activities at the SVECS were performed during the operator's weekly visits during this reporting period. These activities include general site inspections (of the grounds, buildings, doors and locks), collection of operational data (vapor flowrates, pressures, vacuums, temperature and photoionization detector [PID] readings), adjustment of system valves, collection of vapor samples (on a monthly and quarterly basis), collection/disposal of condensate if needed, cleaning of filters, switching of lead/lag blower assignments, and preventive maintenance of system equipment.

2.2 Non-routine Maintenance / Site Activities

No non-routine activities or repair items of note were performed during this quarterly reporting period.

3.0 SVECS MONITORING

Several process vapor samples are collected on a monthly basis to monitor the SVECS operation. These samples consist of an influent sample (as well as a duplicate sample), located immediately prior to the VGAC unit, and an effluent sample, located after the VGAC unit and before the exhaust stack. Vapor samples are also collected from the 12 original SVEWs on a quarterly basis to monitor the capture of the contaminated soil vapor by the SVEWs. In addition, quarterly pressure measurements are collected from the SVEWs and SVPMs to monitor the SVECS vacuum field, and soil gas sampling for SVPMs is conducted annually (generally in the winter time-frame) to evaluate the effectiveness of the SVECS. The first annual soil gas sampling event was conducted in the winter 2012-2013, and samples were collected from the 18 SVPMs in January 2013, as discussed in Section 3.4 below.

3.1 Monthly Air Quality Monitoring

Analysis of influent and effluent vapor sample locations is performed to evaluate VOC mass removal and the effectiveness of the VGAC adsorption unit. Time-integrated vapor samples are collected using 6-L summa canisters with 30-minute flow regulators.

Treated off-gas discharged at the exhaust stack is subject to emissions limitations and associated calculations approved by the NYSDEC DAR in February 2010. A copy of the NYSDEC approved calculations is presented in the Air Permit Equivalent included as **Appendix A**.

A summary of monthly vapor sampling results collected in January, February, and March (First Quarter) is presented in **Tables 1, 2, and 3**, respectively. Emission rate calculations for both the influent stream (prior to VGAC treatment) and effluent stream (following VGAC treatment) and estimated monthly mass recoveries are also presented. Emission rates of the influent stream are calculated to monitor progress and determine when influent concentrations have reached levels at which vapor treatment via carbon adsorption is no longer required. The data presented in **Tables 1, 2, and 3** demonstrate that all constituents were within the effluent emission rates (**Appendix A**). Raw analytical data is provided under a separate cover.

3.2 Quarterly Air Quality Monitoring of SVEWs

Time-integrated vapor samples are collected quarterly using 6-L summa canisters with 30-minute flow regulators at six intermediate and six deep SVE wells. The samples are collected for the purpose of tracking and documenting the performance of the SVECS (TtEC 2010).

Quarterly vapor samples were collected on 15 January from the 12 SVEWs. A summary of detected compounds is included as **Table 4**. Analytical results of select VOCs (1,1,1-TCA, PCE, and TCE) detected at the 12 SVEWs during the First Quarter monitoring event are presented graphically as **Figure 5**. Raw analytical data is provided under a separate cover. Historical analytical results of quarterly vapor samples collected from December 2009 through the First Quarter 2013 are presented in **Table 5**.

3.3 Quarterly Vapor Monitoring of SVEWs and Off-site SVPMS

Pressure readings are collected quarterly from the 12 SVEWs and 18 SVPMS in order to monitor the SVECS vacuum field. Valve positions of the SVEWs are also recorded at this time. Pressure readings from the 18 SVPMS were collected both before and after the collection of soil gas samples from these locations, on 15 January and 16 January, respectively. Results of the First Quarter vapor monitoring are presented in **Table 6**. As indicated, vacuum/soil vapor pressure measurements ranged from (-) 0.01 to (-) 0.04 i.w. during the First Quarter monitoring event. Pressure readings from the 18 SVPMS are presented graphically as **Figure 6**.

Historical results of quarterly vapor monitoring from Third Quarter 2012 through First Quarter 2013 are presented in **Table 7**.

3.4 Annual Vapor Quality Monitoring of Off-site SVPMS

Time-integrated vapor samples are collected annually using 6-L summa canisters with 30-minute flow regulators at 18 SVPMS locations.

3.4.1 Vapor Quality Results

Annual vapor samples were collected on 15-16 January from the 18 SVPMS locations. Validated analytical results of samples collected in January 2013 are summarized in **Table 8**. As indicated, 1,1,1-TCA was detected in only one location, SVPMS-2007D, at a concentration of 1.3 J $\mu\text{g}/\text{m}^3$. PCE was detected at 11 of the 18 locations, with concentrations ranging from 0.97 J $\mu\text{g}/\text{m}^3$ at SVPMS-2003I to 2.3 J $\mu\text{g}/\text{m}^3$ at SVPMS-2004D. TCE was detected at seven of the 18 locations, with concentrations ranging from 4.9 $\mu\text{g}/\text{m}^3$ at SVPMS-2003S to 47 $\mu\text{g}/\text{m}^3$ at SVPMS-2006I. All detected concentrations were well below the NYSDOH sub-slab screening values of 1,000 $\mu\text{g}/\text{m}^3$ for 1,1,1-TCA, 1,000 $\mu\text{g}/\text{m}^3$ for PCE, and 250 $\mu\text{g}/\text{m}^3$ for TCE.

Data validation reports and a validated analytical data summary are presented in **Appendix B**. Raw analytical data is provided under separate cover.

3.4.2 Quality Assurance/Quality Control Sampling

Quality assurance/quality control (QA/QC) samples were collected during the annual off-site vapor monitoring event in accordance with the *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan* (TtNUS 2012). These samples consisted of blind field duplicates (collected from SVPMS 2001D and SVPMS 2007D) and field blanks as ambient air samples.

For field blanks, ambient air samples were collected simultaneously during the soil gas sampling to evaluate potential chemicals in the local ambient air. The 6-L summa canister was positioned at an upwind location at a height of four feet above grade. The ambient air sample was obtained over an eight-hour period for each day that routine samples were collected.

For field duplicate samples, the precision between the original sample and its duplicate is evaluated by calculating the relative percent difference (RPD). RPDs for the First Quarter sampling event are presented in the data validation report in **Appendix B**. As indicated, RPDs for all analytes were well below the guideline of 50% with the exception of TCE for duplicate pair SVPMS2007D / DUP02. This

elevated RPD of 61.9% is likely the result of low estimated values of the analyte and not indicative of date precision concerns. The overall consistency between the samples and its duplicate verifies that proper sample collection methods were followed.

3.5 Soil Vapor Quality Concentration Trends

Historical vapor analytical results for the 12 SVEWs through the First Quarter are presented in **Table 5**. In addition, concentration trends of select VOCs over time for the SVECS combined influent (1,1,1-TCA, PCE, TCE, and total VOCs) and each of the 12 SVEWs (1,1,1-TCA, PCE, and TCE) are presented in **Appendix C**.

Concentration trends observed in the 12 SVEWs through the First Quarter are discussed below. In general, unless otherwise indicated, concentrations of 1,1,1-TCA, PCE, and TCE exhibited similar trends at each given location.

- Combined Influent: Overall VOC concentrations in the combined influent decreased slightly throughout the First Quarter, with total VOC concentrations of 2,788 µg/m³, 2,492 µg/m³, and 2,244 µg/m³ in January, February, and March, respectively. Overall concentrations remain well below baseline concentrations observed in December 2009 when a total VOC concentration of 63,650 µg/m³ was observed.
- SV-101I: Concentrations observed at this location decreased somewhat in the First Quarter from concentrations observed in the latter half of 2012, with concentrations of 8,100 µg/m³ TCE, 80 µg/m³ PCE, and 3,400 µg/m³ 1,1,1-TCA. All concentrations remain well below baseline concentrations observed in December 2009 (180,000 µg/m³ TCE, 1,700 µg/m³ PCE, and 51,000 µg/m³ 1,1,1-TCA), which were also peak concentrations observed to date.
- SV-101D: Concentrations observed at this location decreased in the First Quarter from concentrations observed in 2012, with concentrations of 120 µg/m³ TCE, 130 µg/m³ PCE, and non-detectable levels of 1,1,1-TCA. All concentrations remain well below baseline concentrations observed in December 2009 (100,000 µg/m³ TCE, 3,200 µg/m³ PCE, and 26,000 µg/m³ 1,1,1-TCA), which were also peak concentrations observed to date.
- SV-102I: First Quarter concentrations (10 µg/m³ TCE, 2.4 µg/m³ PCE, and non-detectable 1,1,1-TCA) are similar to those observed in 2012. Though First Quarter concentrations are slightly above baseline concentrations observed in December 2009 (5.6 µg/m³ TCE, 2.4 µg/m³ PCE, and non-detectable 1,1,1-TCA), the concentrations are well below peak concentrations observed in June 2010 (300 µg/m³ TCE, 17 µg/m³ PCE, and 13 µg/m³ 1,1,1-TCE).
- SV-102D: Concentrations observed at this location decreased in the First Quarter from concentrations observed in 2012, reaching the lowest levels observed thus far, with concentrations of 6.5 µg/m³ TCE, 0.96 µg/m³ PCE, and non-detectable levels of 1,1,1-TCA. Concentrations remain well below baseline concentrations observed in December 2009 (440 µg/m³ TCE, 10 µg/m³ PCE, and 130 µg/m³ 1,1,1-TCA), and also well below peak concentrations observed in December 2009 and October 2011.

- SV-103I: Concentrations observed at this location decreased in the First Quarter from concentrations observed in 2012, with concentrations of 16 µg/m³ TCE, 40 µg/m³ PCE, and non-detectable levels of 1,1,1-TCA. Concentrations remain well below baseline concentrations observed in December 2009 (900 µg/m³ TCE, 580 µg/m³ PCE, and 900 µg/m³ 1,1,1-TCA), and also well below peak concentrations observed in December 2009 and October 2011.
- SV-103D: Concentrations observed at this location decreased in the First Quarter from concentrations observed in 2012, with concentrations of 6.0 µg/m³ TCE, 1.6 µg/m³ PCE, and non-detectable levels of 1,1,1-TCA. Concentrations remain well below baseline concentrations observed in December 2009 (3,100 µg/m³ TCE, 20,000 µg/m³ PCE, and 3,000 µg/m³ 1,1,1-TCA), and also well below peak concentrations observed in December 2009 and March 2010.
- SV-104I: Concentrations observed at this location remained very low in the First Quarter, with concentrations of 3.1 µg/m³ TCE, 4.8 µg/m³ PCE, and non-detectable levels of 1,1,1-TCA. All concentrations remain well below baseline concentrations observed in December 2009 (710 µg/m³ TCE, 3,100 µg/m³ PCE, and 730 µg/m³ 1,1,1-TCA).
- SV-104D: Concentrations observed at this location in the First Quarter remained relatively consistent with concentrations observed in 2012, with concentrations of 2,100 µg/m³ TCE, 4,200 µg/m³ PCE, and 820 µg/m³ 1,1,1-TCA. All concentrations remain below baseline concentrations observed in December 2009 (4,600 µg/m³ TCE, 20,000 µg/m³ PCE, and 3,600 µg/m³ 1,1,1-TCA) and also well below peak concentrations observed in December 2009 and March 2010.
- SV-105I: Concentrations observed at this location in the First Quarter remained relatively consistent with concentrations observed in 2012, with concentrations of 160 µg/m³ TCE, 66 µg/m³ PCE, and 22 µg/m³ 1,1,1-TCA. Though these concentrations are above baseline concentrations observed in December 2009 for TCE and 1,1,1-TCA (76 µg/m³ TCE, 70 µg/m³ PCE, and 9.9 µg/m³ 1,1,1-TCA), they are below peak concentrations observed in June 2010 (370 µg/m³ TCE, 240 µg/m³ PCE, and 29 µg/m³ 1,1,1-TCA).
- SV-105D: Concentrations observed at this location in the First Quarter remained relatively consistent with concentrations observed in 2012, with concentrations of 3,800 µg/m³ TCE, 330 µg/m³ PCE, and 430 µg/m³ 1,1,1-TCA. Though these concentrations are above baseline concentrations observed in December 2009 for TCE (1,700 µg/m³ TCE, 2,100 µg/m³ PCE, and 550 µg/m³ 1,1,1-TCA), they are below peak concentrations observed for all three analytes , including TCE (7,000 µg/m³ TCE in December 2011).
- SV-106I: Concentrations observed at this location in the First Quarter remained relatively consistent with concentrations observed in 2012, with concentrations of 110 µg/m³ TCE, 7.0 µg/m³ PCE, and non-detectable levels of 1,1,1-TCA. All concentrations remain well below baseline concentrations observed in December 2009 (1,900 µg/m³ TCE, 390 µg/m³ PCE, and 220 µg/m³ 1,1,1-TCA), which were also peak concentrations observed to date.
- SV-106D: Concentrations observed at this location in the First Quarter fell to non-detectable levels for all three analytes. This is well below baseline concentrations observed in December

2009 (3,400 µg/m³ TCE, 720 µg/m³ PCE, and 340 µg/m³ 1,1,1-TCA), which were also peak concentrations observed to date.

4.0 CONCLUSIONS AND RECOMMENDATIONS

As stated previously, the intent of the Site 1 SVECS is to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture soil vapor with elevated TCE concentrations. Based on the presence of a vacuum field and the reduction of VOC concentrations to less than the screening values in the off-property area, the SVECS is functioning as designed. Influent vapor analytical data with concentrations of TCE consistently greater than 250 µg/L indicate that the SVECS should continue to be operated on a full-time basis to achieve continued capture of contaminated soil vapor. Monthly monitoring of the combined influent and effluent as well as quarterly monitoring of individual SVEWs should continue. Quarterly and annual monitoring of the SVPMs should also continue in order to ensure that a measurable vacuum field is being established and that the area is being effectively treated. Ongoing optimization activities should be performed in order to improve system performance.

Notes:

i.w. = inches of water column

SVEW = soil vapor extraction well

SVPM = soil vapor pressure monitor

Vacuum readings for the SVPMs were measured using a portable Magnehelic® Differential Pressure Gauge 2000-0, with a range of 0-0.50 i.w. Vacuum readings for SVEWs were recorded from dedicated in-line pressure gauges.

Notes:

i.w. = inches of water column

SVEW = soil vapor extraction well

SVPMS = soil vapor pressure monitor

Vacuum readings for the SVPMS were measured using a portable Magnehelic® Differential Pressure Gauge 2000-0, with a range of 0-0.50 i.w. Vacuum readings for SVEWs were recorded from dedicated in-line vacuum gauges.

RE: Naval Weapons Industrial Research Plant(NWIRP)
Site-Bethpage, NYSDEC No. 1-30-003B.

Dear Ms. Fly:

Tetra Tech FW, on behalf of the Department of the Navy (Navy), has submitted the enclosed New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR) Air Permit Application as a permit equivalent. This DAR Air permit equivalent is for the soil vapor extraction system at Site 1 of Plant 3 of the former Naval Weapons Industrial Reserve Plant (NWIRP) site in Bethpage, NY. The NYSDEC Division of Environmental Remediation (DER) has reviewed the permit equivalent and, by means of this letter approves the Site 1 remedy air discharge for immediate operation.

The NWIRP Site 1 SVE system utilizes the reasonably available control technology (RACT) with activated carbon. The air discharge will be periodically monitored at start up and will be added for routine monitoring in the operation, maintenance and monitoring (OMM) plan, to be submitted shortly for Departmental review.

If you have any questions, please contact me at your earliest convenience at (518)402-9620.

Sincerely,

Steven M. Scharf, P.E.
Project Engineer
Division of Environmental Remediation
Bureau of Remedial Action A

**DATA VALIDATION REPORT AND
VALIDATED DATA SUMMARY**

DATA USABILITY SUMMARY REPORT (DUSR)
VOLATILE ORGANIC COMPOUNDS
USEPA Region II –Data Validation

Project Name: Naval Weapons Industrial Reserve Plant, Site 1
Location: 999 Oyster Bay Rd, Bethpage, NY
Project Number: 2034-104
SDG #: 1301315
Client: H&S Environmental, Inc.
Date: 02/22/2013
Laboratory: Air Toxics Ltd.
Reviewer: Sherri Pullar

Summary:

1. Data validation was performed on the data for twenty (20) air samples and 2 (two) field blank samples were analyzed for Volatiles by TO-15 in accordance to NYSDEC, Analytical Services Protocol (ASP) Format.
2. The samples were collected on 01/15-16/2013. The samples were submitted to Air Toxics Ltd., Folsom, CA on 01/18/2013 for analysis.
3. The USEPA Region-II SOP # HW-31, Revision 4, October 2006, Validating Air Samples Volatile Organic Analysis of Ambient Air in Canister by Method TO-15 was used in evaluating the Volatiles data in this summary report.
4. In general, the data are valid as reported and may be used for decision making purposes. Selected data points were qualified due to nonconformance of certain Quality Control criteria (see discussion below).

Samples:

The samples included in this review are listed below:

Sample Conditions/Problems:

1. The Traffic Reports/Chain-of-Custody Records, Sampling Report and/or Laboratory Case Narrative did not indicate any problems with sample receipt, condition of samples, analytical problems or special circumstances affecting the quality of the data. No qualifications were required.

Holding Times:

1. All air samples were analyzed within the method holding time for summa canisters (30 days). No qualifications were required.

GC/MS Tuning:

1. All of the BFB tunes in the initial and continuing calibrations met the percent relative abundance criteria. No qualifications were required.

Initial Calibration:

1. Initial calibration curve analyzed on 01/15/2013 (msdp.1) exhibited acceptable %RSDs ($\leq 30.0\%$) for all compounds and average RRF values (≥ 0.050) for all compounds with the exception of some compounds listed in section 15.5, Page 13 in SOP # HW-31 were ≥ 0.01 with the following exception(s):

Compound	RRF	%RSD
Styrene	A	30.736

A= Acceptable

BPS1-FB2002-011513	1301315-22A	Styrene	UJ

Continuing Calibration Verification (CCV):

1. CCV analyzed on 01/25/2013 @ 10:13AM (msdp.1) exhibited acceptable %Ds ($\leq 30.0\%$) for all compounds. No qualifications were required.
2. CCV analyzed on 01/26/2013 @ 10:52AM (msdp.1) exhibited acceptable %Ds ($\leq 30.0\%$) for all compounds. No qualifications were required.

Surrogates:

1. All surrogates %REC values for all water samples and associated QC were within the laboratory control limits. No qualifications were required.

Internal Standard (IS) Area Performance:

1. All samples exhibited acceptable area count for all three internal standards within the QC limits. No qualifications were required.

Method Blank (MB), Storage Blank (SB), Trip Blank (TB), Field Blank (FB), Rinsate Blank (RB, Equipment Blank (EB) and Canister Certification:

1. Method Blank (1301315-23A) analyzed on 01/25/13 was free of contamination with the exception of the following:

Laboratory Control Sample (LCS)/ Laboratory Control Sample Duplicate (LCSD):

1. Laboratory Control Samples (1301315-25A/AA) were analyzed on 01/25/2013. All %RECs and RPDs were within the laboratory control limits. No qualifications were required.

2. Laboratory Control Samples (1301315-25B/BB) were analyzed on 01/26/2013. All %RECs and RPDs were within the laboratory control limits. No qualifications were required.

Field Duplicate:

1. Sample BPS1-DUP01-011513 (1301315-19A) was collected as field duplicate for sample BPS1-SVPM2001D-0115213 (1301315-03A). All RPDs were $\leq 50.0\%$. Tetrahydrofuran was detected in the field sample but was non-detect in the field duplicate sample.

Field Sample	Analyte	Analytical Method	Result	Units	Field Duplicate	Result	Units	RPD	Qualifier
BPS1-SVPM2001D-0115213	Tetrahydrofuran	TO-15	1.7	$\mu\text{g}/\text{M}^3$	BPS1-DUP01-011513	ND	$\mu\text{g}/\text{M}^3$	NC	J/UJ

Target Compound Identification:

1. All Relative Retention Times (RRTs) of the reported compounds were within ± 0.06 RRT units of the standard (opening CCV).
2. Sample compound spectra were compared against the laboratory standard spectra.
3. No QC deviations were observed.

Compound Quantitation and Reported Detection Limits:

1. All sample results were reported within the linear calibration range. No qualifications were required.
2. Manual Calculation:

$$\text{Concentration } (\mu\text{g/m}^3) = \frac{\text{Result (ppbv)} \times \text{Molecular weight} \times \text{DF}}{24.46}$$

BPS1-SVPM2001S-011513 (1301315-01A)

1,2,4-Trimethylbenzene

Result (ppbv) = 0.2325

Molecular Weight @ 25°C=92.14

DF = 1.34

$$\text{Concentration } (\mu\text{g/m}^3) = \frac{0.2325 \times 92.14 \times 1.34}{24.46} = 1.1735 \mu\text{g/m}^3$$

Compound	Laboratory ($\mu\text{g}/\text{m}^3$)	Validation ($\mu\text{g}/\text{m}^3$)	%D
1,2,4-Trimethylbenzene	1.1	1.1	0.0

Comments:

1. Volatile data package meet requirement for New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocol (ASP) Category B Deliverables.
2. Validation qualifiers (if required) were entered into the EDD for SDG: 1301315.
3. Summary of the qualified data is listed in the Data Summary Table for SDG: 1301315.
